# OVERVIEW

This project is an implementation of commit / post-recieve hooks for various VCS systems, that send a notification to an AMQP server containing payload that follows the github payload spec :

# DEVELOPMENT PRACTICES

## 2.1 General ideas

Code in this project should satisfy following requirements:

- PEP8 compliant
- Covered with testcases not less than 90%
- Covered with documentation
- Reviewed

## 2.2 Code Quality

We use `pylint` with default settings to check the code compliance:

```
pylint <your-file>
```

Code rated  $< 9$  is **NOT** acceptable.

Before you commit your changes please run the unit tests

Make sure that all the test cases pass and code coverage is more than 90%.

After you fix a defect please create a test case to avoid regressions in future.

## 2.3 Documenting your code

For documenting we use `sphinx` You can find project documentation in docs directory of the project

Here are recommendations of documenting API:

If you document your functions this way:

```
def foo(param1, param2):  
    """Description of foo.  
  
    :param param1: param1 description  
    :type param1: string  
  
    :param param2: param2 description  
    :type param2: list
```

```
:returns: tuple (<category name>, <list of items>)
:rtype: tuple

"""

# some code here

return (category, items)
```

you'll have this nice documentation generated by *sphinx*:

```
docfunc.foo(param1, param2)
    Description of foo.

Parameters

    • param1 (string) – param1 description
    • param2 (list) – param2 description

Returns tuple (<category name>, <list of items>)

Return type tuple
```

The same is for classes:

```
class Foo(object):
    """Class description."""

    #: class attribute description.
    classattr = None

    def method(self, param1, param2):
        """
        Method description.
        Could take several lines.

        :param param1: param1 description
        :type param1: string
        :param param2: param2 description
        :type param2: list

        """

        pass

class docclass.Foo
    Class description.

    classattr
        class attribute description.

    method(param1, param2)
        Method description. Could take several lines.

    Parameters

    • param1 (string) – param1 description
    • param2 (list) – param2 description
```

Some useful links related to *sphinx*:

- <http://docutils.sourceforge.net/docs/user/rst/quickref.html>

- <http://sphinx.pocoo.org/markup/code.html>
- <http://sphinx.pocoo.org/ext/autodoc.html>

## 2.4 Branching policy

Recommended way is to have separate git branch for each task. After code is ready branch can be rebased against master and provided for review.

Please note that **No code should go to master without review** It's reviewer task to review the code, discuss it with developer, then merge it to master and tag it if needed.

## 2.5 Building Debian Package

Use:

```
git-buildpackage -rfakeroot -uc -us -sa -D
```

to build packages.

Build debian package is a recommended way to check your work, because project documentation is re-generated and unit tests are run during package building.

# MODULES AND CLASSES

Contents:

## 3.1 Senders

### 3.1.1 amqp

AMQP sender API.

```
class vcsamqp.senders.amqp.BasicAMQPSender (config={'exchange': '', 'delivery_mode': 1,
                                                    'queue_auto_delete': False, 'vhost': '/vcsamqp',
                                                    'host': 'hemeego-sidev-h001.europe.nokia.com',
                                                    'user': 'vcsamqp', 'password': '123', 'port':
                                                    5672, 'queue_exclusive': False, 'queue_durable':
                                                    True, 'queue_name': 'vcsamqp-queue', 'routing_key':
                                                    'vcsamqp-queue', 'exchange_type':
                                                    'topic'})
```

Base abstract class for AMQP senders.

**send\_payload** (*payload*)

Send payload to the server. Abstract method. Has to be implemented in derived classes.

**Parameters** *payload* (*dictionary*) – data to be sent

```
class vcsamqp.senders.amqp.BlockingAMQPSender (config={'exchange': '', 'delivery_mode':
                                                    1, 'queue_auto_delete': False, 'vhost':
                                                    '/vcsamqp', 'host': 'hemeego-sidev-
                                                    h001.europe.nokia.com', 'user': 'vc-
                                                    samqp', 'password': '123', 'port': 5672,
                                                    'queue_exclusive': False, 'queue_durable':
                                                    True, 'queue_name': 'vcsamqp-queue',
                                                    'routing_key': 'vcsamqp-queue', 'ex-
                                                    change_type': 'topic'})
```

Blocking (synchronous) sender. Code is borrowed from Pika Blocking demo\_send [example\\_blocking](#):

**send\_payload** (*payload*)

Send payload to the server using blocking approach.

**Parameters** *payload* (*dictionary*) – data to be sent

```
class vcsamqp.senders.amqp.AsyncAMQPSender (config={'exchange': '', 'delivery_mode': 1,
                                                    'queue_auto_delete': False, 'vhost': '/vcsamqp',
                                                    'host': 'hemeego-sidev-h001.europe.nokia.com',
                                                    'user': 'vcsamqp', 'password': '123', 'port':
                                                    5672, 'queue_exclusive': False, 'queue_durable':
                                                    True, 'queue_name': 'vcsamqp-queue', 'routing_key':
                                                    'vcsamqp-queue', 'exchange_type':
                                                    'topic'})
```

Asynchronous Sender. Code is borrowed from Pika Asynchronous demo\_send [example\\_async](#):

Methods are placed in the same order as they're called by pika

**on\_channel\_open** (*channel*)

Callback. Called when channel has opened.

**Parameters** **channel** (*object*) – channel object

**on\_connected** (*connection*)

Callback. Called when we are fully connected to RabbitMQ.

**Parameters** **connection** (*object*) – connection object

**on\_queue\_declared** (*\_frame*)

Callback: Called when queue has been declared.

**Parameters** **\_frame** (*object*) – response from broker

**send\_payload** (*payload*)

Send payload to the server setting up chain of callbacks: on\_connected -> on\_channel\_open -> on\_queue\_declared. (see above)

**Parameters** **payload** (*dictionary*) – data to be sent

### 3.1.2 log

```
class vcsamqp.senders.log.FileLogger (filename)
```

**send\_payload** (*payload*)

## 3.2 Listeners

### 3.2.1 amqp

AMQP Listener.

```
class vcsamqp.listeners.amqp.BaseAMQPListener (config={'exchange': '', 'delivery_mode':
                                                         1, 'queue_auto_delete': False, 'vhost':
                                                         '/vcsamqp', 'host': 'hemeego-sidev-
                                                         h001.europe.nokia.com', 'user': 'vc-
                                                         samqp', 'password': '123', 'port': 5672,
                                                         'queue_exclusive': False, 'queue_durable':
                                                         True, 'queue_name': 'vcsamqp-queue',
                                                         'routing_key': 'vcsamqp-queue', 'ex-
                                                         change_type': 'topic'})
```

Base abstract class for AMQP listeners.

**receive\_payload** (*channel, method, header, body*)

Recieve payload from the server. Abstract method. Has to be implemented in derived classes.

**Parameters** *body* (*dictionary*) – data received

```
class vcsamqp.listeners.amqp.AsyncAMQPListener (config={'exchange': '', 'delivery_mode':
1, 'queue_auto_delete': False, 'vhost':
'vcsamqp', 'host': 'hemeego-sidev-
h001.europe.nokia.com', 'user': 'vc-
samqp', 'password': '123', 'port': 5672,
'queue_exclusive': False, 'queue_durable':
True, 'queue_name': 'vcsamqp-queue',
'routing_key': 'vcsamqp-queue', 'ex-
change_type': 'topic'})
```

Asynchronous Listener.

**consume** ()

Start the IO event loop so we can communicate with RabbitMQ.

**on\_channel\_open** (*channel*)

Step #3: Called when our channel has opened.

**Parameters** *channel* (*object*) – channel object

**on\_connected** (*connection*)

Step #2: Called when we are fully connected to RabbitMQ.

**Parameters** *connection* (*object*) – connection object

**on\_exchange\_declared** (*frame*)

Step #4: Called when the exchange has been declared.

**Parameters** *\_frame* (*object*) – response from broker

**on\_queue\_bound** (*frame*)

Step #6: Called when the queue has been bound to the exchange.

**Parameters** *\_frame* (*object*) – response from broker

**on\_queue\_declared** (*frame*)

Step #5: Called when Queue has been declared.

*frame* is the response from RabbitMQ

**receive\_payload** (*channel, method, header, body*)

Step #7: Called when we receive a message from RabbitMQ. Implementation of recieve\_payload that just prints the payload.

**Parameters** *body* (*dictionary*) – data received

**setup\_connection** ()

Step #1: Connect to RabbitMQ.
